ROS Tutorial

ROS Tutorial

Topics

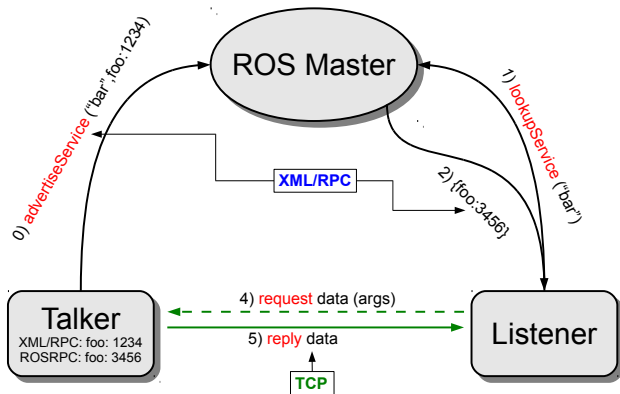

- ▶ **nodes** connect via **topics**
- ▶ the discovery of who publishes on what topic is done via a **ROS master**

ROS Tutorial

Services

► synchronous services

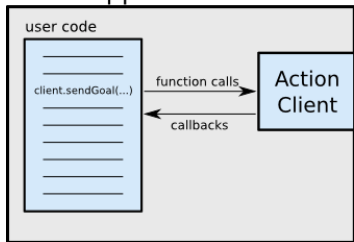

ROS Tutorial

Actions (1/2)

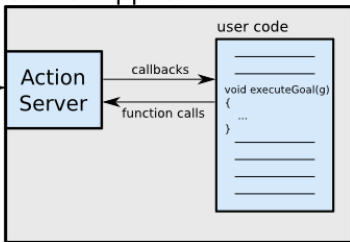

Using function calls and callbacks

- ▶ request goals (client side)
- ▶ execute goals (server side)

Client Application

Server Application

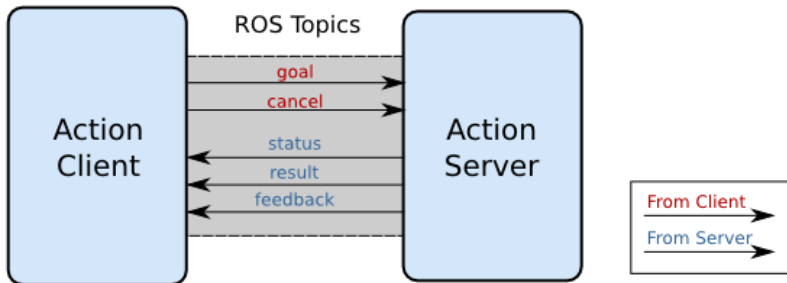

ROS Tutorial

Actions (2/2)

- ▶ **action protocol** relies on ROS topics to transport messages

Action Interface

ROS Tutorial

Messages

- ▶ defined in `package-name/msg/*.msg` files, sent over topics
- ▶ basic data types:
 - ▶ `int{8,16,32,64}`
 - ▶ `float{32,64}`
 - ▶ `string`
 - ▶ `time`
 - ▶ `duration`
 - ▶ `array[]`
- ▶ Example: *Point.msg*

```
float64 x
float64 y
float64 z
```
- ▶ used in **ROS services**, defined in `package-name/srv/*.srv`
Service = Request msg + Response msg

ROS Tutorial

Parameters (1/2)

- ▶ nodes can set **parameters** on the server
- ▶ any other nodes can read them

ROS Tutorial

Parameters (2/2)

- ▶ have unique names
- ▶ can represent primitive data types:
 - ▶ integers
 - ▶ floats
 - ▶ boolean
 - ▶ dictionaries
 - ▶ maps, etc
- ▶ can be set and remapped at runtime
- ▶ stored on the parameter server

ROS Tutorial

Packages and Stacks

- ▶ **Packages** : directories with a certain structure, can contain anything: **nodes**, **messages**, **tools**
- ▶ in their most basic form:
 - ▶ *package_name*
 - ▶ *package_name/Makefile*
 - ▶ *package_name/CMakeLists.txt*
 - ▶ *package_name/manifest.xml*
- ▶ **ROS core** = small, but **ROS universe** = many packages !!!
- ▶ **Stacks** : collection of packages
- ▶ in their most basic form:
 - ▶ *stack_name/*
 - ▶ *stack_name/package_name_1*
 - ▶ *stack_name/package_name_N*
 - ▶ *stack_name/stack.xml*

Documentation

ROS is an open-source, meta-operating system for your robot. It provides the services you would expect from an operating system, including hardware abstraction, low-level device control, implementation of commonly-used functionality, message-passing between processes, and package management.

ROS:

[ROS Installation Instructions](#)

Provides instructions on how to install ROS on your machine.

[Getting Started with ROS](#)

Provides tutorials and technical overview of ROS. Also check out the [@ROScheatsheet.pdf](#)

[Getting Help](#)

Provides a short list of links for how to ask questions and get help with ROS.

[Getting Involved](#)

How to contribute to the ROS community.

Software Built on ROS:

[Core Libraries by Functionality](#)

Lists available APIs within ROS by language and topic.

[Code Repositories](#)

There's a broad community contributing open-source software for ROS. This lists many of the known code repositories that build on top of ROS.

[Search Software](#)

Search for libraries across the entire ROS community.

Example

▶ simulator_stage demo

4. Run stageros with an existing world file

The `stage` package ships with some example world files, including one that puts an Erratic-like robot in a Willow Garage-like environment. To run it:

```
roscd stage  
./bin/stageros world/willow-erratic.world
```

You should see a Stage window pop up that looks something like this:
